SLTT Ceramic3P

A REMOVAL HERO WITH STEEL BACK PLATE

The new Ceramic3P ceramic grain with self-sharpening effect stands for Persistence, Precision and Power. Characteristics that are reflected in its performance.

- The stable steel backing pad allows a good heat dissipation, which results in a cool grinding and minimises the need for finishing work. The high-quality resin system prevents flap chipping, even at high speeds or high working temperatures. The flat position of the perfectly bonded sickle flaps not only offers greater work safety, but also reduces any tool wear. The abrasive grain adheres firmly to the backing, resulting in a high removal rate per minute.
- Thanks to the self-sharpening effect of the ceramic grain, the flap disc is particularly suitable for working on hard and tough materials such as stainless steel. High removal rates and a long life are guaranteed with this tool.
